Re: *Verizon Petition for Waiver of April 17, 2026*, PS Docket No. 21-479; *Commonwealth of Massachusetts State 911 Department Phase 1 Request of April 4, 2025*, PS Docket No. 25-143
Supplement to Verizon Petition for Waiver

Dear Ms. Dortch:

This letter provides a further update of Verizon's wireline Phase 1 implementation efforts for the 911 Authorities covered by the above-referenced Petition for Waiver (the "Petition"), together with an overview of PS/ALI service to ensure that the nature of the service for MLTS users, and its relation to NG911 deployment, are accurately reflected in the record.

Phase 1 Status Updates. The attachment to Verizon's August 19, 2026 letter supplement listed the Phase 1 implementation status for 911 Authority requests subject to the scope of Verizon's Waiver Request.¹ Following discussions with Bureau staff and recent developments, we are providing updated information for a few Phase 1 requests:

- New Hampshire. This request is subject to a further mutual agreement extension through September 30, 2026 (corrected from the July 31, 2026 date indicated in the August 19th attachment). Verizon completed provisioning VoIP customer records with Intrado in early June, and completed provisioning TDM customer records with Intrado on September 3. Intrado is working with the State to complete its connectivity to the state's NGCS provider. Once completed, we will coordinate with Intrado to initiate SIP delivery.

¹ To clarify, Verizon originally requested waiver relief through June 30, 2026 for requests submitted on or before November 1, 2025, and through July 31, 2026 for requests submitted between November 1, 2025 and January 31, 2026.

- Illinois (served by INdigital). Verizon has since completed migration of all VoIP records to Intrado and has been delivering our 911 traffic via SIP as of September 4, 2026.
- Ohio. Verizon has completed provisioning VoIP customers, but has held further efforts to deliver 911 calls via SIP in abeyance at the State's request pending resolution of a technical matter with the underlying NGCS provider.
- Rhode Island. Verizon completed provisioning VoIP customer records with Intrado in early June, and completed provisioning TDM customer records on September 3. Verizon VoIP 9-1-1 traffic is being delivered via SIP as of September 4, 2026 and we tentatively expect to complete SIP delivery of all Verizon 9-1-1 calls well before the end of September. This will serve as Verizon's second major transition of TDM-based customers in its ILEC territory, after Massachusetts.

PS/ALI Service and Market Structure. In light of recent stakeholder inquiries concerning the PS/ALI issues described in Verizon's Petition, and related discussions with Bureau staff, we are providing a more thorough description of PS/ALI service to ensure a complete and accurate record.

Private Switch Automatic Location Information (PS/ALI) is a longstanding service offered by wireline 911 service providers, developed initially to enable enterprise customers to manage the location of phones at their premises connected to an on-premises Private Branch Exchange (PBX). PS/ALI users were easily identifiable, both as a service associated with legacy ILEC offerings, and because the service required an enterprise to apply for and receive a NENA Company ID (COID). The 911 service provider and the Public Safety Answering Point (PSAP) used a COID to identify the enterprise, and the enterprise's COID further assisted the PSAP in resolving ALI discrepancies.

Today, the term PS/ALI is used in a legacy wireline 911 environment *and* by Next Generation Core Service (NGCS) providers, and has evolved to encompass support for certain ILEC-offered products (e.g., Centrex), hosted VoIP call servers, and enterprise-owned and operated PBX/call servers. When a 911 Authority contracts with an NGCS provider, however, the responsibility for accepting location data from the appropriate source and using it for call routing and delivery to the PSAP moves from the legacy wireline 911 service provider to the NGCS. In a pre-NG911 environment, all entities that utilize PS/ALI must transition their provisioning of location data to the new 911 service provider (i.e. the NGCS) when that occurs. (As an example, DDTi now has that responsibility in Massachusetts where Verizon formerly served as the wireline 911 provider.) For Verizon enterprise customers in jurisdictions that have transitioned to Phase 1, however, the Intrado solution receives the 911 caller's ANI, queries its database, and based on the associated location, sends the call as a SIP Invite with a location query key to the NGCS provider. The Intrado platform does not send the device ANI to the 911 service provider, so to route a 9-1-1 call from a PS/ALI user, the device location data must reside in the Intrado platform, not with the 911 service provider. This configuration is part and parcel to an NGCS provider's end-state NG911 configuration and not unique to Verizon.

Verizon remains a wireline 911 service provider within some of its Verizon ILEC and Frontier footprints. In these areas, Verizon may still offer a PS/ALI service for telephone numbers located within that specific jurisdiction. Outside of those jurisdictions, however, Verizon cannot offer PS/ALI solutions to its enterprise customers. But even though Verizon has not directly provided PS/ALI in Massachusetts for well over a decade, we continue to work diligently to identify PS/ALI users there and in other jurisdictions, and we support their provisioning with Intrado at no charge. For customers with PS/ALI agreements, our 911 compliance team has reached out to each enterprise using the contact information we have on file. If the contact data is outdated, we use other means available to identify the appropriate contact within the enterprise customer.² But Verizon customers using a PS/ALI service not provided by Verizon do not always identify the telephone numbers managed by that third party service. To address those customers, we have created an outreach program for every enterprise customer, reminding them that they are responsible for maintaining their device 911 location data and instructing how to enable Verizon to incorporate their MLTS into the Intrado solution.

Finally, when a 9-1-1 call cannot be delivered to the PSAP because there is no location data, Verizon has established a team that reviews the daily report of 911 calls sent to the Intrado Emergency Call Relay Center (ECRC) for investigation. If an enterprise is identified, the 911 team reaches out to educate the enterprise of the need for Verizon to obtain the device location data to incorporate it into the Intrado solution. Some PS/ALI users are not reachable despite our diligent efforts, however, and may have their calls routed via the ECRC for a number of reasons outside of Verizon's control, including for example:

- The customer's contact data is outdated.
- Merger activity or corporate reorganization has moved the customer's responsibility for 911 location management to another department or subsidiary.
- The customer who called 911 cannot identify who is internally responsible for managing 911 location data.
- When the 911 team reaches out to the telephone number that made the 911 call that routed to the ECRC, the call originates from a device in a public space and goes unanswered.
- The enterprise uses call forwarding from a security desk to 911 and the security desk personnel have no association with the team that manages voice technologies for the enterprise.

² As previously explained, in addition to the direct notification approach Verizon has briefed or formally notified each 911 Authority with a Phase 1 request on file prior to March 1, 2026, every known NGCS provider associated with a Phase 1 request, APCO, ATIS, NASNA, NENA and the National 9-1-1 Program office of the issue. Verizon has further notified its sales, solution architect, and professional services organizations of the PS/ALI issues. *See* Verizon Letter in PS Docket 21-479 at 1-2 (July 7, 2026); Verizon Letter in PS Docket 21-479 at 1-2 (May 28, 2026).

Thus, even in the most favorable of circumstances, OSPs will face limits in their ability to apprise MLTS managers and operators of network changes with implications for their 911 calling responsibilities.

Please contact me if there are questions concerning this filing.

Sincerely,

A handwritten signature in blue ink that reads "Robert G. Morse". The signature is written in a cursive, flowing style with a large initial "R" and "M".
